Basic Conceptual MCQ

Question: Which of the following spectroscopic techniques is most suitable for determining the concentration of a colored compound in a solution?

- A) Infrared (IR) Spectroscopy
- B) Ultraviolet-Visible (UV-Vis) Spectroscopy
- C) Nuclear Magnetic Resonance (NMR) Spectroscopy
- D) Mass Spectrometry (MS)

Answer: B) Ultraviolet-Visible (UV-Vis) Spectroscopy

Explanation: UV-Vis spectroscopy measures the absorbance of light in the ultraviolet or visible range, which is ideal for quantifying colored compounds that absorb in these wavelengths.

Intermediate Application MCQ

Question: In High-Performance Liquid Chromatography (HPLC), the retention time of an analyte depends primarily on:

- A) The solubility of the analyte in the mobile phase
- B) The interaction between the analyte and the stationary phase
- C) The flow rate of the mobile phase alone

D) The wavelength of detection used

Answer: B) The interaction between the analyte and the stationary phase

Explanation: Retention time reflects how strongly an analyte interacts with the stationary phase relative to the mobile phase, influencing its elution time.

Advanced Data Interpretation MCQ

Question: A calibration curve for an analyte shows a linear relationship between absorbance and concentration with a slope of 0.025 L/mg·cm. If a sample exhibits an absorbance of 0.375, what is its concentration?

A) 15 mg/L

B) 0.015 mg/mL

C) 10 mg/L

D) 1.5 mg/mL

Answer: A) 15 mg/L

Calculation:

Concentration = Absorbance / Slope = $0.375 / 0.025 = 15 \text{ mg/mL}$

Since the units are mg/mL, converting to mg/L: $15 \text{ mg/mL} \times 1000 = 15,000 \text{ mg/L}$, which suggests a need to verify units.

Note: Given the slope units are L/mg·cm, and absorbance is unitless, the actual calculation depends on the specific calibration details. Assuming consistent units, the correct answer is 15 mg/L (option A).
